DETAILED ACTION

Applicant's election without traverse of species of figure 5 (claims 11-13 and 16) in the reply filed on September 8, 2005 is acknowledged.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

Claims 11-13 and 16 are rejected under 35 U.S.C. 102(e) as being anticipated by Shapira et al. US 20030162566A1. Referring to claims 11-13, Shapira discloses in figures 1 and 18 a method for antenna tracking, comprising: processing/weighting orthogonally polarized tracking channel components of an incident signal to make a determination as to which of the orthogonally polarized tracking channel components is stronger (see page 1 [0008]); and using the determination to

Art Unit: 3662

select a polarization of a data channel to reduce a polarization mismatch loss (see Abstract).

Referring to claim 16, Shapira teaches the means for detecting orthogonally polarized signals of a tracking channel, determining which of the orthogonally polarized signals is stronger, and suppressing a cross polarization response of the tracking channel includes a tracking receiver configured to switch between tracking channel inputs for the orthogonally polarized signals and to generate sequential outputs, and a sequential summer configured to receive the sequential outputs and to generate a summed output that is weighed by a polarization mismatch loss of the orthogonally polarized signals (see [0065 – 0077]).

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The prior art cited to (Kurokami; Cook, Jr.; Fitzsimmons et al.; T.R. fouts et al.) show various antenna tracking systems including suppressing cross polarization interference.
